

## From the Archives – Potatoes in the Late 1990's

By: Ross Coleman  
RLF State Manager, South Australia

Looking back through the RLF archives revealed the following series of interesting photographs showing the performance of RLF products on potatoes during the late 1990's.

What's particularly interesting is how positive the outcomes were through the use of RLF products in the early days. Today, with our more advanced products we expect these reliable results on a regular basis. But here is a snapshot of what our archival search found.

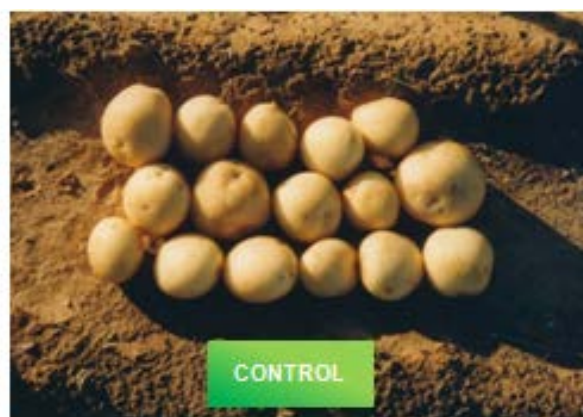

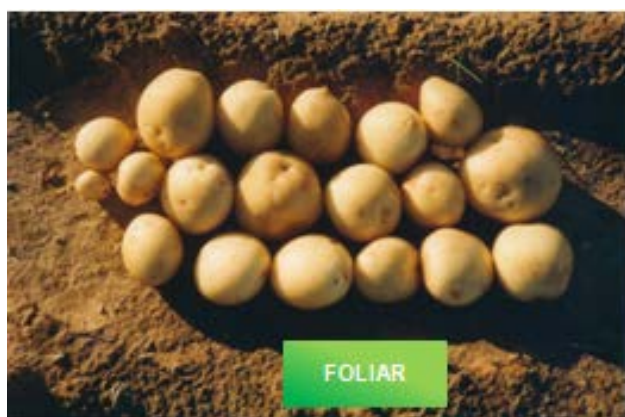

**Baroota SA Potato Crop Field**

**Seed Priming**

Also included is a photo from those early years of the potato seed that was dressed with an RLF product and then excavated soon after emergence to check out the improved root development. This was clearly obvious.

Even back then, and in all cases, we saw better yield, better uniformity and better colour of the potato tubers where RLF foliar products were at work.

The content of this media page was accurate and current at the time that it was written. This media release is provided for interested customers and other parties, and will remain a matter of RLF's historical record. Viewed in this context RLF therefore undertakes no obligation to update either material or content.
