

A COMMON SIGHT – ALL YEAR ROUND

This Insight presents the opportunities that **Plasma 828** brings for horticultural growers.

This is a common sight in most horticulture regions around Australia.

Ground being readied for planting the next potato, onion, carrot, lettuce, cauliflower or broccoli crop. And many Growers are planting something, pretty much all year round.

Plasma 828 has ‘opened’ many eyes and presented great new opportunities for our customers since its introduction to our range. It is proving to be a much more cost-effective ZMC program for growers, and has shown great results over recent years.

Recently, one of the first horticultural growers in Australia to purchase a 1,000L shuttle of **Plasma 828**, admitted to an all-important improvement in carrot colour, saying that he might put it down to the weather to other growers ! But to the team at RLF he will say it’s a result of the Plasma. He summed up further by affirming; “I’m putting it on everything else now – all my potatoes and the other crops, everything.”

We at RLF feel pretty smug when we hear stories like this – and we do – all year round.
