

THE ADDED BONUS OF 'BSN TWIN'

This Insight shows how the increased nutritional status of **BSN-primed seed** actually started growing a second plant.

By our Regional Correspondents

Our representatives been constantly observing and picking up on the many positive influences RLF's products have on crops.

One very positive influence noticed was whilst out and about in the Wilmington area of South Australia, (4 hours north of capital city Adelaide) conducting some crop inspections. They saw that due to the increased nutritional status of **BSN-primed seed**, it actually started to grow a second plant.

The picture shows the secondary seedling on the right hand side of both plants. It clearly shows that the plant on the right may not succeed, whereas the plant on the left more likely will. More and more farmers, each season, come to understand the importance of the nutritional status of the seed - and the key role played by **BSN**.
